1984 FACTS

- The 1984 Corvette was a complete redesign in almost every aspect. Handling considerations dominated and the result was praised by the motoring press as the world's best cornering automobile.
- The 1984 Corvette was introduced in March 1983. Because it met all 1984 federal requirements, Chevrolet decided to skip the 1983 model designation. The result was a very long production run and the second highest model year volume in the Corvette's history. 1983 Corvettes were built, serial numbered, and tested by both Chevrolet and the motoring press at the "long lead" preview at Riverside Raceway in December 1982. But 1983 Corvettes were not released for public sale.
- Design criteria specified that the 1984 Corvette have more ground clearance and more interior room, but less overall height. In order to achieve it, engineers routed the exhaust system through the center tunnel.
- A "4+3", 4-speed manual transmission, built by Doug Nash, had overdrives in the top three gears for improved fuel economy. Not available early.
- All 1984 Corvettes were designed with one-piece, lift-off roof panels and rear hatch windows. At the time, the rear window glass was the largest compound glass ever installed in an American automobile. The front windshield was raked at the greatest angle, 64%.
- Brakes remained disc at all four wheels, but components were new and included aluminum calipers supplied by Girlock of Australia.
- Electronic instrumentation was standard and included digital readouts for engine monitoring and liquid crystal graphic displays for speed and engine revolutions. Analog instrumentation was not available.
- The 1984 Corvette was designed with a pad protruding from the passenger side of the dash. This was part of a passive restraint system conceived when it was assumed the federal regulation would require such restraints. The Reagan Administration dropped the restraint proposals, but the Corvette's pad remained.
- The 1984 Corvette was designed without fiberglass seams on exposed panels to eliminate factory finishing. The exterior seams were under the rub strip extending around the entire body.
- The radiator was a new design using aluminum for the cooling fins and plastic for the reservoirs. A thermostatically controlled electric fan operates only when needed and only under 35mph.
- Chevrolet built specially modified 1984 Corvettes for the export markets of European, Middle East, Japanese, and Latin American countries. Changes included different license plate provisions, leaded fuel capability, and electrical, glass, lighting and mirror modifications.
- Single transverse plastic leaf springs were used front and rear.

- A 350ci, 205hp engine, 4-speed automatic transmission, removable body-color roof panel, and cloth seats were included in the base price.
- Optional leather seats were the same design as the base cloth style. Sport seats were available in cloth (different material than base) and featured inflatable lumbar support and power-adjusted side bolsters.
- The RPO QZD 16-inch tire and wheel package, initially intended to be included as part of the Z51 option, and as a separate option for base models, was required for all 1984 Corvettes sold. The scheduled standard 15-inch alloy wheels and P215/65R15 tires were not used.
- RPO Z51 included heavy-duty front and rear springs, shock absorbers, stabilizer bars and bushings, fast steering ratio, engine oil cooler, extra radiator fan (pusher), P255/50VR16 tires and directional alloy wheels, 16x8.5-inch front, 16x9.5-inch rear.

ENGINE ASSEMBLY IDENTIFICATION

CHEVROLET ENGINE PRODUCTION CODE

Chevrolet produced engines are stamped with a source, production date and engine suffix. Other General Motors produced engines used in Chevrolet vehicles will use a label affixed to the engine assembly. A complete list of all alphabetic codes used, regardless of manufacturer, appear in the following pages.

Source Code	Month Code	Day Code	Engine Type
V = Flint Engine	12th Month	10th Day	See Following Charts
F = Flint Motor	December		
T = Tonawanda			
K = GM of Canada			
R = Moraine			
M = GM of Mexico			
A = Ramos - Mexico			

In addition, all engines have a portion of the vehicle identification number stamped near the engine production code. This consists of the division code, model year, assembly plant and vehicle build sequence number.

Vehicle Make (Division — 3rd Position of VIN)	Model Year	Assembly Plant	Vehicle Sequence Number
I	F	R	1 2 3 4 5 6

*NOTE: Pre 1980 production used numerical characters (last digit of model year) to identify model year. 1980 started the progressive use of alphabetic characters.

NOTE:

1. This form uses both SI metric units and U.S. Customary units. The metric unit of measure is presented first, and the U.S. Customary unit follows in parentheses.
2. UNLESS OTHERWISE INDICATED:
 - a. Specifications apply to standard models without optional equipment. Significant deviations are noted.
 - b. Nominal design dimensions are used throughout these specifications.
 - c. All linear dimensions are in millimeters (inches), and all mass (weight) specifications are in kilograms (pounds).
3. The General Specifications herein are those in effect at date of completion and are subject to change without notice by the manufacturer.
4. Additional Car and Body Dimensions and/or drawings (based in part on SAE J1100a "Motor Vehicle Dimensions") may be available from the manufacturer.

Brakes — Service

Description		Aluminum caliper with nodular iron reaction bracket; pad reaction thru bracket.	
Brake type (std., opt., n.a.)	Front (disc or drum)	Disc with sliding-head caliper, low drag	
	Rear (disc or drum)	Disc with sliding-head caliper, low drag	
Self-adjusting (std., opt., n.a.)		Standard	
Special valving	Type (proportion, delay, metering, other)	Proportioning, Integral with Master Cylinder	
Power brake (std., opt., n.a.)		Standard	
Booster type (remote, integral, vac., hyd., etc.)		Integral; lightweight with tru-bolt reaction system	
Vacuum source (inline, pump, etc.)		Inline (Intake Manifold)	
Vacuum reservoir (volume in 3)		--	
Vacuum pump-type (elec., gear driven, belt driven, if other so state)		--	
Anti-skid device type (std., opt., n.a.) (F/R)		Not Available	
Effective area (cm ² (in ²))*		322 (50.0)

Dimensions Definitions

Seating Reference Point

SEATING REFERENCE POINT means the manufacturer's design reference point which —
 (a) Establishes the rearmost normal design driving or riding position of each designated seating position in a vehicle;
 (b) Has coordinates established relative to the design vehicle structure;
 (c) Simulates the position of the pivot center of the human torso and thigh; and
 (d) Is the reference point employed to position the two dimensional templates described in SAE Recommended Practice J826, "Manikins for Use in Defining Vehicle Seating Accommodations," November 1962.

Width Dimensions

- W101 TREAD—FRONT The dimension measured between the tire centerlines at the ground
- W102 TREAD—REAR The dimension measured between the tire centerlines at the ground. In case of dual wheels, the dimension will be measured to the centerline of tire and wheel assemblies
- W103 VEHICLE WIDTH The maximum dimension measured between the widest point on the vehicle, excluding exterior mirrors, flexible mud flaps, marker lamps, but including bumpers, moldings, sheet metal protrusions or dual wheels, if standard equipment.
- W117 BODY WIDTH AT SgRP—FRONT The dimension measured laterally between the widest points on the body at the SgRP-front, excluding door handles, applied moldings, or appliques.
- W120 VEHICLE WIDTH—FRONT DOORS OPEN The dimension measured between the widest point on the front doors in maximum hold-open position
- W121 VEHICLE WIDTH—REAR DOORS OPEN The dimension measured between the widest point on the rear doors in maximum hold-open position. For vehicles with a rear door on only one side, this dimension is to the zero "Y" plane
- W122 TUMBLE HOME STRAIGHT SIDE GLASS The angle measured from a vertical to the outside surface of the front door glass at the SgRP "X" plane.
CURVED SIDE GLASS. The angle measured from a vertical to a chord extending from the upper DLO to the lower DLO at the outside surface of the front door glass at the front SgRP "X" plane.

Length Dimensions

- L30 FRONT OF DASH "X" COORDINATE A minus (-) dimension indicates actual front of dash in forward of the zero "X" plane
- L101 WHEELBASE (WB). The dimension measured longitudinally between front and rear wheel centerlines. In case of dual rear axles, the dimension shall be to the midpoint of the centerlines of the rear wheels
- L102 TIRE SIZE As specified by the manufacturer.
- L103 VEHICLE LENGTH. The maximum dimension measured longitudinally between the foremost point and the rearmost point on the vehicle, including bumper, bumper guards, tow hooks and/or rub strips, if standard equipment.
- L104 OVERHANG—FRONT. The dimension measured longitudinally from the centerline of the front wheels to the foremost point on the vehicle including bumper, bumper guards, tow hooks and/or rub strips, if standard equipment.

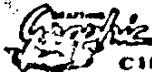

- L105 OVERHANG—REAR The dimension measured longitudinally from the centerline of the rear wheels, or in the case of dual rear axles, the dimension shall be the midpoint of the centerlines of the rear wheels, to the rearmost point on the vehicle, including rear bumpers, bumper guards, tow hooks and rub strips, if standard equipment.
- L123 UPPER STRUCTURE LENGTH The dimension measured longitudinally from the cowl point to the deck point
- L127 REAR WHEEL CENTERLINE "X" COORDINATE or in the case of dual rear axles, the coordinate shall be in the midpoint of the distance between the rear axle centerlines
- L125 COWL POINT "X" COORDINATE

Height Dimensions

- H101 VEHICLE HEIGHT The dimension measured vertically from the highest point on the vehicle body to ground
- H114 COWL POINT TO GROUND Measured at zero "Y" plane
- H13B DECK POINT TO GROUND Measured at zero "Y" plane
- H112 ROCKER PANEL—FRONT TO GROUND The dimension measured vertically from the foremost point on the bottom of the rocker panels, excluding flanges to ground
- H132 BOTTOM OF DOOR OPEN—FRONT TO GROUND The dimension measured vertically from the bottom outside corner of the door on the lock pillar side, maximum hold-open position, to ground
- H111 ROCKER PANEL—REAR TO GROUND The dimension measured vertically from the bottom of the rocker or side quarter panel at the front of the rear wheel opening, excluding flanges, to ground
- H134 BOTTOM OF DOOR OPEN—REAR TO GROUND The dimension measured vertically from the bottom outside corner of the door on the lock pillar side, in maximum hold-open position, to ground
- H135 BOTTOM OF DOOR CLOSED—REAR TO GROUND The dimension measured vertically from the bottom outside corner of the door on the lock pillar side, in maximum closed position, to ground
- H121 BACKLIGHT SLOPE ANGLE The angle between the vertical reference line and the surface of backlight at vehicle zero "Y" plane. For curve backlight, the angle is to chord of backlight arc from lower DLO to upper DLO.
- H122 WINDSHIELD SLOPE ANGLE The angle between the vertical reference line and a chord of the windshield are running from the lower DLO to the upper DLO at the vehicle zero "Y" plane. In the case of wrap over glass, the angle to be measured will be formed by a chord 457 mm (18.0 in) long drawn from the lower DLO to the intersecting point on the windshield
- H127 HEADLAMP TO GROUND—CURB MASS (WT) The dimension measured vertically from the centerline of the lowest headlamp lens to ground
- H128 TAILLAMP TO GROUND—CURB MASS (WT) The dimension measured vertically from the centerline of the upper bulb to ground

Ground Clearance Dimensions

- H102 FRONT BUMPER TO GROUND The minimum dimension measured vertically from the lowest point on the front bumper to ground, including bumper guards, if standard equipment
